Joint disease of stallion

Owner: training stable Tanja Golla, Ostbüren, Germany

Patient: 7 year old Quarter Horse stallion

Due to a joint disease, the stallion had to stand for 2 weeks and could only be walked.

Since he was used in sport and breeding, he became very aggressive.

RelaxoHorse®-Stressless was used with a sound frequency of two times four hours a day. The first successes in behavior could already be seen in the evening of the first day of treatment. After three days, easy handling was possible.

The disease could heal smoothly due to the rest periods

Fissure of foal

Owner: training stable Birgit Walters, Thülen, Germany

Patient: filly

A four-month-old warm-blooded foal suffered from a fissure on the cannon bone on the way to the mare show and therefore had to stand in the box.

The foal was used to enjoy life on the field with the foaling mare and jumped restlessly in the box. Tranquilizers had to take effect quickly to avert the danger of a complete fracture.

RelaxoHorse® - Relaxing was first used and after two hours of sound exposure, the foal had calmed down and was sleeping next to the mare. To the amazement of the owner, all the horses in the barn had fallen into a relaxation phase.

On the second day we used **RelaxoHorse® - Stressless** in a constant sound exposure. From day to day the foal became more relaxed. From the 14th day the foal was held without sound exposure and was calm and balanced.

After another two weeks, there were renewed anxiety attacks due to unavoidable construction noise. After sound exposure of about 45 minutes with **RelaxoHorse® - Stressless** the foal was resting in spite of the extreme noise level.

After eight weeks, the fissure had healed without complications.

AQ Championship

Owner Frank Schabbehardt et al, Unna, Germany

Patients: 6 American Quarter Horses (4 mares, 2 geldings)

Housed in outdoor paddocks next to each other, the horses are increasingly suffering from adverse weather conditions that evolve to severe weather. The animals are excited, afraid and want to break free.

By coincidence, a trainer has **RelaxoHorse[®]-Stressless** in her vehicle. Targeted sound exposure is started immediately.

After 20 minutes of sound exposure with **RelaxoHorse[®]-Stressless**, four horses were lying calmly in the paddock and the other two horses were standing relaxed in their outer paddocks.

The owners of the horses were very relieved and no longer want to do without **RelaxoHorse[®]**.
