

GO ON SAFARI FOR GREAT FLASH RESULTS

Feature-packed and with plenty of power, Lencarta's Safari 2 portable flash is great for on-location shooting

If you want full control of on-location lighting you need to leave your hotshoe flashguns at home and pick something altogether more potent. Lencarta's Safari 2 portable flash kit is akin to having a fully powered studio lighting set-up and gives you the ultimate in on-location versatility. Available in one- and two-head kits, the secret to Safari 2's versatility is the fact that each head has its own 600Ws generator, which offers power that can be adjusted in 1/3 stop increments over a five-stop range (from full to 1/32nd power). That makes it the only portable flash system offering true asymmetric power adjustment and means that a two-head kit pumps out an impressive 1200Ws of flash. But there are lots of other reasons why Safari 2 should be on your location flash shopping list, including these:

- You can enjoy working cable free thanks to the WaveSync Commander system, which is also used in Lencarta's Superfast and Atom units so you can mix and match for greater versatility. It's also going to be compatible with future flash heads, too.
- The heads are metal-bodied so not only are they robust, they can also easily support the weight of modifiers and accessories. And, because they use the popular S-fit system, a huge range of attachments is also available.
- Despite the impressive power output, the batteries last for 400 full power flashes. The battery life is also linear, so if you shoot at 1/32nd power you'll get 32 times more shots – that's 12,800 flashes! Plus the fast recycling easily keeps up with the action and the short flash duration freezes it.

- An integral slave cell means that the units can be triggered by an integral or hotshoe flash. There are both S1 and S2 slave options so the cell can be set to respond to or ignore the first flash – handy if the unit you're using fires a pre-flash.
- There's no danger of overheating thanks to the unit's overheating protection mechanism, plus the 15W LED modelling light provides the equivalent to a 150W tungsten bulb. What's more, it can be left on indefinitely, so it's great for videographers.
- The units are easy to use, with a clear digital display, a control dial and well-labelled buttons making it simple to quickly set up the units as you need them.

Portraiture, weddings, product photography and much more can all be embellished using the Lencarta Safari 2 system. Just be warned that once you start shooting with flash outdoors, you'll soon get addicted to using it!
